Also called *perencephalitis*, *mania gravis*, and *typhomania*.—*Bright's disease*, a disease, or group of diseases, first described in 1827 by Richard Bright, an English physician (1783-1858). The name is usually applied to forms of kidney disease characterized by albuminuria and general dropsy. dismal (dis-māl'), *a.* and *n.* [*Early mod. E. also dismall, disemall, disemold, dysmal, dysmal; < ME. dismal, disemall, disemold, disemall, disemall, found first as a noun in the phrase "in the dismal" (see quot. under II, 1), of which the orig. meaning is not certain, but which prob. stands for "in the dismal days or time," the word being most frequent in the phrase dismal day or dismal days (see quot. under I.). The origin and meaning of the word have been much debated. It was certainly borrowed, and prob. from the OF. From its lack of a recognized literal meaning in E., it must have been borrowed in a figurative sense. "It is just possible that the original sense of in the dismal [days or time] was in tithing time; with reference to the cruel extortion practiced by feudal lords, who exacted tithes from their vassals even more peremptorily than tithes were demanded for the church." (Skeat.) This view, which is prob. correct, is based upon what appears to be phonetically the only possible origin of ME. dismal, namely, < OF. *dismal, F. démal (vernacular form of decimal, F. décimal) = Sp. diezmal = Pg. diezmal, Sp. Pg. also decimal = E. decimal, < ML. decimalis, of a tenth, of tithes, < L. decimus, tenth, ML. fem. decima, a tenth, a tithe, > OF. disme, F. dime, ME. disme, E. dime, a tithe, tenth: see decimal and dime. The notion of official extortion appears further in the related OF. dismer, dismer, decimate, exact tithes, hence despoil (= Sp. diezmar = Pg. diezmar, pay tithes, decimate: see decimate), and in escheat, cheat, q. v.]*

3. In optics, the separation of the different colored rays in refraction, arising from their different wave-lengths. The point of dispersion is the

point where refracted rays begin to diverge. When a ray of sunlight is made to pass through prisms of different substances, but of such angles as to produce the same mean deviation of the ray, it is found that the spectra formed are of different lengths. Thus, the spectrum formed by a prism of oil of cassia is found to be two or three times longer than one formed by a glass prism; the oil of cassia is therefore said to *disperse* the rays of light more than the glass, or to have a greater dispersive power. It is also found that in spectra formed by prisms of different substances the colored spaces have to one another ratios differing from the ratios of the lengths of the spectra which they compose; and this property has been called the *irrationality of dispersion* or of the colored spaces in the spectrum. See *prism* and *refraction*.

Dispersion has been accounted for by the different speeds of light of different wave-lengths in the same refracting medium.

Tait, Light, § 72.

In consequence of . . . *dispersion* of the colours in various directions of vibration, white light becomes broken up in a mode which is comparable with the *dispersion* of colour by ordinary refraction, and on this account has received the name of circular or rotary *dispersion*.

4. In med. and surg., the scattering or removal of inflammation from a part and the restoration of the part to its natural state.—5. In math., the excess of the average value of a function at less than an infinitesimal distance from a point over the value at that point, this excess being divided by $\frac{1}{n}$ of the square of the limiting infinitesimal distance. **Abnormal dispersion**, in optics, a phenomenon exhibited by solutions of some substances, as fuchsin, which give spectra differing from the usual prismatic spectrum in the order of the colors. **Cone of dispersion**. See *cone*. **Dispersion of the bisectrices**, in crystal, the separation of the bisectrices for different colors observed in many monoclinic and triclinic crystals when the position of the three axes of light-elasticity is not the same for all the rays of the spectrum. It may be *crossed*, *horizontal*, or *inclined*. It is *crossed* when the acute bisectrix coincides with the ortho-diagonal axis. When a section of a biaxial crystal cut normal to the acute bisectrix is viewed in converging polarized light, the dispersion of the optic axes or bisectrices is generally marked by the arrangement of the colors in the interference-figures seen. It is *horizontal* when the obtuse bisectrix coincides with the ortho-diagonal axis; and *inclined*, in monoclinic crystals, when the optic axis lies in the plane of symmetry.—**Dispersion of the optic axes**, in crystal, the separation of the axes for different colors in biaxial crystals, which takes place when the axial angles have different values; it is usually described as $\alpha > \beta$, or $\alpha < \beta$, according as the angle for red rays is greater or less than that for blue rays.—**Epipolite dispersion**. See *epipolite*.—**The dispersion**, the Jews dispersed among the Gentiles during and after the Babylonian captivity; the diaspora: most frequently used of the scattered communities of Jews referred to in the New Testament, either of such communities collectively and in general, or of the communities in some single country or group of countries: as, the *Dispersion of Asia Minor*; the *Dispersion of Egypt*; the *Dispersion in Rome*. Also *dissociation*.

The word was first employed by Henri Sainte-Claire Deville, who in November, 1857, read before the French Academy of Sciences a paper "On the *Dissociation* or Spontaneous Decomposition of Bodies under the Influence of Heat."

In the earliest method of spinning, the staff, usually a cleft stick about 3 feet long, on which was wound a quantity of wool, cotton, or flax to be spun. The lower end of the distaff was held between the left arm and the side, and the thread, passing through and guided by the fingers of the left hand, was drawn out and twisted by those of the right, and wound on a suspended spindle made so as to be revolved like a top, which completed the twist. In Eastern countries and in some districts of Europe, especially in Italy, the primitive distaff and spindle are still used; but after the introduction of the spinning-wheel into Europe, about the fifteenth century, the distaff became an attachment only of that designed for flax, and thus continued in general use till a recent period, modified in form.

The loaded distaff in the left hand placed,
With spiny coils of snow white wool was graced;
From these the right hand lengthening fibres drew,
Which into thread 'neath nimble fingers grew.

2. The volatilization and subsequent condensation of a liquid by means of an alembic, a still and refrigeratory, or a retort and receiver; the operation of obtaining the spirit, essence, or essential oil of a substance by the evaporation and condensation of the liquid in which it has been macerated; rectification; in the widest sense, the whole process of extracting the essential principle of a substance. The most common method of conducting the process of distillation consists

in placing the liquid to be distilled in a boiler of copper or other suitable material, called the *still*, having a movable head from which proceeds a coiled tube called the *worm*, which passes through water constantly kept cold. Heat being applied to the still, the liquid in it is volatilized, and rises in vapor into the head of the still, whence, passing down the curved tube or worm, it becomes condensed by the cold water, and makes its exit in a liquid state. The object of distillation is to separate volatile liquids from non-volatile liquids and solid matters, and also, by the operation called *fractional distillation* (which see, below), to separate from each other volatile liquids which have different boiling-points. The process is used in the arts, in the manufacture of alcohol and spirituous liquors, for preparing essences and essential oils, and for a great variety of other purposes.

The mixture is distilled in an apparatus which admits of constant observation of the temperature, and the liquids obtained between certain intervals of temperature (five or ten degrees) are collected separately. The more volatile liquid will be found chiefly in the "fractions" first collected; and by repeating the process with the first fraction, this more volatile liquid may be obtained in a state of comparative or absolute purity.

Distoma (dis-tō-mi), *n.* [NL., < Gr. *diatoros*, two-mouthed, < *di-*, two-, + *stoma*, mouth.] 1. The typical and leading genus of the family *Distomidae*; a genus of trematoid or suckling parasitic worms, or flukes, of which *D. hepaticum*, the liver-fluke, is the best-known. *D. hepaticum* is often found in the liver of sheep, in which it causes the disease called rot, but it also occurs in man and various other animals. In form it is ovate, flattened, and presents two suckers (whence the name), of which the anterior is perforated by the oral aperture, and the posterior median one is approximated to it; there is a complicated branched water-vascular system, the intestine is branched and without an anus. It has been shown that the ciliated embryo passes into *Limnaea truncatula*, and there gives rise to a sporocyst which develops rediae, which produce other rediae, or cercariae, which are tadpole-like larvae; these after swimming for a time become encysted, as, for example, on blades of grass, and in this state are eaten by sheep. Numerous species of the genus are described. *D. hamatobium*, from the veins of man, is now referred to the genus *Bilharzia*. See *ent* under *cercaria*.

2. [*l. c.*] An animal belonging to this genus.

The developmental stages of *Distoma* militare may be summed up as: (1) Ciliated larva, (2) Redia, (3) Cercaria, (4) Cercaria, tailless and encysted, or incomplete *Distoma*, (5) Perfect *Distoma*. *Hu-ley, Anat. Invert., p. 181.*

3. Same as *Distomus*, 1. *Savigny, 1816.*

Distomus (dis-tō-mō-s), *n. pl.* [NL., < Gr. *diatoros*, two-mouthed; see *Distoma*.] A superfamily group of trematoid worms or flukes. They have at most two suckers and no hooks. They develop by a complicated alternation of generations, the larval and asexual forms chiefly inhabiting mollusks, while the sexually mature individuals live mostly in the alimentary canal of vertebrates or its appendages. The group includes the families *Distomidae* and *Monostomidae*.

Dimorphic forms are found in certain species of the genera *Monostomum* and *Distomum*; the one individual develops only male sexual organs, the other only female. Such *Distomes* are morphologically hermaphrodite, but practically of separate sexes.

In reference to political divisions in the United States, it generally imports that the inhabitants act together for some one specific purpose: as, a highway district; a school district; an election district (as a senate, assembly, or congressional district). In some States the term is applied to a class of towns. In Tennessee it is called a *civil district*; in Kentucky, a *judicial district*; in Georgia, a *sanitary district*; in Maryland, an *election district*. In other States these divisions are called *towns* or *townships*. In colonial and provincial Massachusetts the district was a part set off from a town and made independent of it in respect to local administration, but not in respect to choosing a representative to the General Court. In the Methodist Episcopal Church the district is a territorial subdivision of a conference, comprising a number of churches and societies, under the charge of a presiding elder. A *military district* of a country is a division of a military territorial department. The federal territory containing the national capital is called the *District of Columbia*. Abbreviated *dist.*

First given artistic form by Arion (about 625 B. C.) and rendered by cyclic choruses, it was perfected, about a century later, by Ison of Hermione, and at about the same time tragedy was developed from it in Attica. Its simpler and more majestic form, as composed by Ison, Simonides, Bacchylides, and Pindar, assumed in the latter part of the fifth century a complexity of rhythmical and musical form and of verbal expression which degenerated in the fourth century into a mimetic performance rendered by a single artist. From these different stages in its history the word *dithyramb* has been used in later ages both for a nobly enthusiastic and elevated and for a wild or inflated composition. There are three leading species: the great northern diver, *Colymbus torquatus*; the black-throated diver, *C. arcticus*; and the red-throated diver, *C. septentrionalis*. All three inhabit the northern hemisphere generally, and are noted not only for their quickness in diving, but also for the length of time they remain and the distance they traverse under water, in which they move both by swimming with the feet and by paddling with the wings. See *loon*. Also *diving-bird*.

2. One who plunges into or engages deeply in anything.—Cartesian diver. See *Cartesian*.

And wider yet in thought and deed

Diverge our pathways, one in youth.

Whittier, *Memories*.

3. To differ from a typical form; vary from a normal state or from the truth.—4. In *math.*, to become larger (in modulus) without limit: said of an infinite series when, on adding the terms, beginning with the first, the sum increases indefinitely toward infinity. A series may be divergent without *diverging*. See *divergent series*, under *divergent*.

divergement (di-və'j-ment), *n.* [*< diverge* + *-ment*.] The act of *diverging*. [Rare.]

Double images in sleepiness are certainly due to *divergence*, not convergence, of the optic axes.
La Conte, *Sight*, p. 253.

Hence—2. Departure from a course or standard; differentiation in action or character; deviation: as, the *divergence* of religious sects; *divergence* from rectitude.

Amer. Jour. Philol., V, 424.

3. In *math.*, the negative of the scalar part of the result of operating with the Hamiltonian operator upon a vector function. See *angle*.

Divergent parabola, a name given by Newton to a cubic parabola or cubic curve having the line at infinity as its inflexional tangent.—**Divergent rays**, rays which, proceeding from a point of a visible object, continually depart from one another in proportion as they recede from the object: opposed to *convergent rays*. Concave lenses render parallel rays *divergent*, convex lenses *convergent*.—**Divergent series**, an infinite series such that, if we begin adding the terms together in their order, we do not ultimately approximate indefinitely toward a finite limit, but either oscillate from one value to another or move toward infinity. Only in the latter case, according to the usage of mathematicians, is a divergent series said to *diverge*. Thus, for instance, the infinite series $1 - 1 + 1 - 1 + 1 - 1 + \dots$ is *divergent* without *diverging*.—**Divergent strabismus**. See *strabismus*.—**Divergent wings**, in *entom.*, wings which in repose are horizontal but spread apart, receding from the abdomen, as in many flies.

divers (di'vərs), *a.* [*< ME. divers, dyvers, diverser, dyverse*, *< OF. divers, F. divers* = Pr. *divers* = Sp. Pg. It. *diverso*, *< L. diversus*, various, different, also written *divorsus*, pp. of *divertere*, *divertere*, turn or go different ways, part, separate, divert: see *divert*. According to modern analogies, the word *divers* would be written *diverse* (pron. di'vərs); association with the *F.* original favored the spelling *divers*; and this form, with the plurality involved in the word, caused it to be regarded as a plural (whence the pron. di'vərs). Hence in mod. speech *divers* is used only with a plural noun. It is now obsolete or archaic, the form *diverse*, regarded as directly from the *L.*, having taken its place. In earlier use *divers* and *diverse* are merely different spellings of the same word; early quotations are therefore here all put under *divers*. See *diverse*.] 1. Different in kind, quality, or manner; various.

The act of divining; the pretended art of foretelling by supernatural or magical means that which is future, or of discovering that which is hidden or obscure. The practice of divination is very ancient, and has played an important part in the theologies of almost all nations. The first attempt to raise divination to the dignity of a science is attributed to the Chaldeans. The innumerable forms which have been in use for thousands of years may be reduced to two classes: (1) that effected by a kind of inspiration or divine afflatus; and (2) that effected by the observation of certain dispositions and collocations of things, circumstances, and appearances, etc., as the flight of birds, the disposition of the clouds, the condition of the entrails of slaughtered animals, the falling of lots, etc.

Divination hath been anciently and fitly divided into artificial and natural; whereof artificial is when the mind maketh a prediction by argument, concluding upon signs and tokens; natural is when the mind hath a presentation by an internal power, without the inducement of a sign.

sunken vessels, etc. Diving-bells have been made of various forms, such as that of a bell, or a hollow truncated cone or pyramid, with the smaller end closed and the larger one, which is placed lowermost, open. The air contained within the bell prevents it from being filled with water on submersion, so that the diver may descend in it and breathe freely, provided he is furnished with a new supply of fresh air as fast as the contained air becomes vitiated by respiration. The diving-bell is now generally made of cast-iron in the form of an oblong chest (A), open at the bottom, and with several strong convex lenses set in its upper side or roof, to admit light to the interior. It is suspended by chains from a barge or other suitable vessel, and can be raised or lowered at pleasure, in accordance with signals given by the persons within, who are supplied with fresh air injected into a flexible pipe by means of a forcing pump (B) placed in the vessel, while the vitiated air escapes by a cock in the upper part of the bell. An improvement on this form, called the *nautilus*, enables the occupant, instead of depending upon the attendants above, as in the older forms, to raise or sink the bell, move about at pleasure, or raise great weights with it and deposit them in any desired spot.

It is thus enabled to remain under water, though fitted only for breathing air. See cut under *Argyroneta*.

diving-stone (di'ving-stón), *n.* A name given to a species of jasper.

divining-rod (di-vi'ning-rod), *n.* A rod or twig used in divining; especially, a twig, generally of hazel, held in the hand and supposed by its bending downward to indicate spots where met-

alliferous deposits or water may be found by digging. It is usually made of two twigs of hazel, or of apple or some other fruit-tree, tied together at the top with thread, or of a naturally forked branch, and is grasped by both hands in such a way that it moves when attracted by the sought-for deposit. This method of searching for ore or water has been in use for centuries, but its efficacy is now rarely credited by intelligent persons.

divisibility (di-viz-i-bil'i-ti), *n.* [= *F. divisibilité* = *Sp. divisibilidad* = *Port. divisibilidade* = *It. divisibilità*, < *ML. *divisibilitas* (-t)s, < *LL. divisibilis*, divisible: see *divisible*.] 1. The capacity of being divided or separated into parts.—2. In arith., the capacity of being exactly divided—that is, divided without remainder.—**Infinite divisibility**, the character of being divisible into parts which are also divisible, and so on ad infinitum. As applied to matter, the term implies properly that any portion of matter may, by the exercise of sufficient force, be separated into parts. After the general acceptance of the Daltonian theory of atoms, the term *infinite divisibility* of matter was long retained with the meaning of the infinite divisibility of space.

The geometers (you know) teach the *divisibility* of quantity in *infinitum*, or without stop, to be mathematically demonstrable. *Boyle*, *Things above Reason*.

I said at first that *infinite divisibility* of matter was the doctrine now in vogue amongst the learned, but upon second thoughts I believe I have misrepresented them, and the mistake arose from want of distinguishing between *infinite* and *indefinite divisibility*.

A. Tucker, *Light of Nature*, III. III. § 12.

divisible (di-viz-i-bl), *a.* and *n.* [= *F. divisible* = *Sp. divisible* = *Port. divisível* = *It. divisibile*, < *LL. divisibilis*, divisible, < *L. dividere*, pp. *divisus*, divide: see *divide*.] I. *a.* 1. Capable of division; that may be separated or disunited; consisting of separable parts or elements: as, a line is *divisible* into an infinite number of points.

The outermost layer of the body is a dense chitinous cuticula, usually *divisible* into several layers.

Huxley, *Anat. Invert.*, p. 546.

2. In arith., capable of division without remainder: as, 100 is *divisible* by 10.

II. *n.* That which is susceptible of division.

Dan. Sw. division*, < *L. divisio* (-n-), division, < *dividere*, pp. *divisus*, divide: see *divide*.] 1. The act of dividing or separating into parts, portions, or shares: as, the *division* of a word (as by means of a hyphen at the end of a line); the *division* of labor; the *division* of profits.

I'll make *division* of my present with you;

Hold, there is half my offer. *Shak.*, *T. N.*, III. 4.

Specifically—(a) [*L. divisio* (-n-), tr. of *Gr. haiparais*.] In logic, the enumeration and naming of the parts of a whole; especially, the enumeration of the species of a genus. The latter is also distinguished as *logical division*. *Division* is mainly distinguished from *classification* in that the latter is a modern word, and supposes minute observation of the facts, while the former, as an Aristotelian term, denotes a much ruder proceeding, based on ordinary knowledge, and undertaken at the outset of the study of the genus divided. One of the distinctive doctrines of the Ramist school of logicians was that all division should proceed by dichotomy.

Division is a dividing of that which is more common to those which are less common. As a definition therefore doth declare what a thing is, so the *division* sheweth how many things are contained in the same.

Sir T. Wilson, *Rule of Reason* (1561).

Division is the parting or dividing of a word or thing that is more general, into other words or things less general.

Blondelle, *Arte de Logica* (1599), II. 3.

(b) In her., the separating of the field by lines in the direction of the bend, the bar, etc. (called *division benches*,

barrier, etc.), also for the purpose of impaling two shields together, or in quartering. (c) The separation of members in a legislative house in order to ascertain the vote. This is effected in the British House of Commons by the passing of the affirmative and negative sides into separate lobbies, to be counted by tellers; in American legislatures, by their rising alternately, or, as is frequently done in the House of Representatives, by passing between tellers standing in front of the Speaker's desk. In the British House of Commons the usual method of voting on any contested measure is by division; in the United States, by ayes and noes, or affirmative and negative answers on a call of the roll.

The motion passed without a division. *Macaulay*.

2. In *arith.*: (a) The operation inverse to multiplication; the finding of a quantity, the quotient, which, multiplied by a given quantity, the divisor, gives another given quantity, the dividend. In elementary arithmetic division is often defined as, for example, "the partition of a greater summe by a lesser" (*Reorde*, 1540); but such a definition applies only when the quotient is an abstract number and an integer. Division is denoted by various signs. Thus, a divided by b may be written in any of the following ways:

$$a \div b, \frac{a}{b}, a/b, a:b, ab^{-1}.$$

Where multiplication is not commutative (that is, where xy is not generally equal to yx) there are two kinds of division; for if $xy = z$, x may be regarded as the quotient of z divided by y , or y as the quotient of z divided by x . These two kinds of division are denoted as follows:

$$xy = z, \frac{xy}{y} = x, \frac{xy}{x} = y, xy:y = x, xy:x = y, x^{-1}(xy) = y.$$

Division is one of the fundamental operations in arithmetic, common algebra, and quaternions; but in other forms of algebra it generally gives an indeterminate quotient, and so loses its importance. (b) A rule or method for ascertaining the quotient of a divisor into a dividend: as, long division. (c) A section; the separation of a geometrical figure into two parts.—3. The state of being divided; separation of parts: as, an army weakened by division; divisions among Christians.

Hate is of all things the mightiest divider; nay, is division itself. *Milton*, *Divorce*, ll. 21.

4. That which divides or separates; a dividing line, partition, or mark of separation; any sign or cause of separation or distinction.

I will put a division between my people and thy people. *Isa.* vii. 21.

5. A part separated or distinguished in any way from the rest; a minor part or aggregate; a distinct portion: as, the divisions of an orange; a division of mankind or of a country; the divisions of a book or of a discourse.

Express the heads of your divisions in as few and clear words as you can. *Seyt*.

Specifically—(a) A definite part of an army or of a fleet, consisting of a certain number of brigades or of vessels under a single commander.

For his divisions, as the times do brawl. *Shak.*, 1 Hen. IV., l. 3.

(b) A part of a ship's company set apart for a certain service in action. Those who serve at the guns are classed as the *first*, *second*, *third*, and *fourth divisions*; the *forward division* provides the guns with ammunition, the *masthead division* steers the ship and work the sails; and the *engineer's division* manage the engines and the boilers. (c) A geographical military command, consisting of two or more departments. Thus, the Military Division of the Missouri consisted of the department of Dakota, the department of the Platte, the department of the Missouri, and the department of Texas. In the military organization of the United States there is at present (1904) but one division (that of the Philippines), which is divided into three departments (Luzon, the Visayas, and Mindanao). There are also eight other departments. See *department*. (d) In *nat. hist.*: (1) In zoological classification, any group of species forming a part of a larger group; in entomology, sometimes specifically applied to a group smaller than a suborder and larger than a family, as the division *Hymenoptera* of the *Heteroptera*. A section may be equivalent in value to a division, or a group subordinate to it; a *series* is a division in which the minor groups show a regular gradation in structure. (2) In botanical classification, one of the higher grades in the sequence of groups, equivalent to *subkingdom* or *series*, as the phenogamous and cryptogamous divisions of plants. It is also often used as subordinate to *class*, as the polypetalous, apetalous, etc., divisions of dicotyledonous plants. By some authors it has been used to designate a grade between *tribe* and *order*.

6. The state of being divided in sentiment or interest; disunion; discord; variance; difference.

Are they not sign and symbol of thy division from Him?
Tennyson, *The Higher Pantheism*.

7. In *music*, a rapid and florid melodic passage or phrase, usually intended to be sung at one breath to a single syllable: so called because originally conceived as the elaboration of a phrase of long tones by the division of each

into several short ones. It was common in the music of the eighteenth century.

Sung by a fair queen in a summer's bower,
With ravishing division, to her lute.
Shak., 1 Hen. IV., iii. 1.

Muscle, advance thee on thy golden wing,
And dance division from sweet string to string.
Middleton, *Blurt*, Master Constable i. 1.

Now that the manager has monopolized the Opera-house, haven't we the signors and signoras culling here, sifting their smooth semibreves, and gargling glib divisions in their outlandish throats?
Sheridan, *The Critic*, i. 1.

8. The precise statement of the points at issue in any dispute. [Rare.]

The division is an opening of thynges wherein we agree and rest upon, and wherein we stick and stand in travers, shewing what we have to say in our owne behalfe.

Sir T. Wilson, *Rhetoric* (1553).

9. See the extracts.

At the University of Cambridge, England, each of the three terms is divided into two parts. Division is the time when this partition is made.

B. H. Hall, *College Words*.
The terms are still further divided, each into two parts; and, after division in the Michaelmas and Lent terms, a student who can assign a good plea for absence to the College authorities may go down and take holiday for the rest of the term.
C. A. Bridget, *English University*, p. 87.

Accidental division, a division of a subject according to its accidents: as, good things are, according to Aristotle, either qualities of mind, qualities of body, or accidents of fortune. **Centesimal division**, *Supercalcul*.

Complementary division, a method of division given by Boethius. The smallest round number larger than the divisor is used, and also the complement of the divisor, or the remainder after subtracting it from the round number. The first figure of the quotient is set down, from the dividend is subtracted the product of this by the round number, and to the remainder is added the product of the same figure of the quotient by the complement of the divisor. The sum is treated as a new dividend. **Complex or compound division**, the division of a complex or compound number either by a number of the same sort or by an abstract number, as the division of 3 days 13 hours 17 minutes by 1 day 18 hours 28 minutes 30 seconds, or by 7. **Direct division**. (a) Division not complementary. (b) A rule for dividing one number by another, so as to obtain the entire period of the circulating decimal of the quotient. Both dividend and divisor are multiplied by the same number so as to make the last significant figure of the divisor 9. By striking off from the divisor so multiplied the 9, together with any ciphers which may follow it, and increasing the truncated remnant by 1, a number is obtained called the current multiplier. The last figure of the multiplied dividend is now struck off, multiplied by the current multiplier, and the product added to the truncated dividend. The sum is treated as a new dividend; and this process is continued until the dividends begin to repeat themselves. The successive figures struck off from the dividend from last to first are now written down from left to right as a whole number, and subtracted from the circulating part of the same figures is placed indefinitely into the decimal places. The remainder, after slitting the decimal point as many places to the left as there were zeros struck off from the divisor along with the 9, is the quotient sought.

Division by circulating decimals, a method of dividing by means of a table of circulating decimals. **Division by factors**, the process of dividing successively by factors of the divisor. **Division by logarithms**, a method of dividing based on the fact that the logarithm of the quotient is the logarithm of the dividend diminished by the logarithm of the divisor. **Division of a ratio**, the reduction of a proportion from $a:b::c:d$ to $b-a::a:d$ —*c. e.* **Division of labor**, in *polit. econ.*, the dividing up of a process or an employment into particular parts so that each person employed can devote himself wholly to one section of the process. **Division of the question**, in a legislative body, the division of complex proposition or motion into distinct propositions, in order that each may be considered and voted upon separately; a course resorted to, upon motion or demand, when any of the members favor parts but not the whole of the measure. The presiding officer usually has the power of deciding whether such division is admissible. **Division viol**, see *viol*. **General division**. See *general*, *n.* **Golden division**, arithmetical division not complementary. **Harmonic division of a line**. See *harmonic*. **Iron division**. Same as *complementary division*. **Logical division**, any division not a partition, being either a nominal, substantial, or accidental division. **Long division**, the common modern method of arithmetical division when the divisor is a number larger than 10. The greatest number of times that the divisor is contained in the first figures of the dividend, beginning with the left (a sufficient number being taken to make a number greater than the divisor), is set down to the right of the dividend, as the first figure of the quotient; the divisor is then multiplied by this quotient, and the product is subtracted from the left-hand part of the dividend; to the remainder the next figure to the right in the dividend is then annexed, and the number thus formed is treated as a new dividend; and so on. The same method is extended in algebra to the division of polynomials in general. The rule is of Italian origin. See *scratch division*.

Nominal division, an enumeration of the different senses of an equivocal word or expression; a distinction.

Partible division, the mental division of a whole into its parts, as of the English nation into sovereigns, lords, and commons; partition. **Real division**, a division relating to facts, not a mere distinction between different meanings of a word, embracing substantial, partible, and accidental division; the explication of a whole by its parts.

Scratch division, the ordinary method of division before long division came into general use, late in the seventeenth century. The products were not set down at all, but only the remainders. The divisor was set down under the dividend; the first figure of the quotient was then set

down and was multiplied by the first figure of the divisor, and the remainder was set down over the corresponding figures of the dividend, which were immediately canceled, together with the first figure of the divisor. This process having been repeated until the whole divisor had been canceled, the latter was written down again one place further to the left, the second figure of the quotient was set down, and the whole proceeding repeated until a remainder was obtained less than the divisor. The following shows the successive stages of the division of 351 by 13:

$$\begin{array}{r} 351 \\ 13 \overline{) 351} \\ \underline{13} \\ 221 \\ \underline{13} \\ 91 \\ \underline{78} \\ 13 \end{array}$$

The rule was derived from Arabian writers.—**Short division**, a process of division practised with a divisor not larger than 10, in which the quotient is set down directly, being written from left to right, usually below a line under the dividend, without auxiliary figures.—**Substantial division**, or **division per se**, the division of a genus into its species. To run division, in *music*, to make florid variations on a theme.

It is often used, however, to signify a judicial separation, or termination of cohabitation, more specifically called a *limited divorce*, or a *divorce a mensa et thoro* (from bed and board); and it is sometimes also used more broadly still of a judicial decree that a supposed marriage never had a valid existence, as in case of fraud or incapacity.

ing: as, to do well by a man.

well to repress any more Copies of the Saffire.

5. [Cf. the equiv. OP. *comment le faites-vous?*

lit. what make you? The sense of *do* in this
usage merges in *do*. See *do*, *down*.] To be

Sheridan, School for Scandal, iii. 3.

manage for: as, he does well for his family. (b) To ruin;

"They have done for me," said Hardy, "said he [Nelson],
as he was raised up on the deck; "my backbone is shot
through."
Amer. Cyc., XII. 722.

To do without, to dispense with; succeed or get along
without: as, I can do without the book till Saturday.

The Romance words are some of them words which we
cannot do without for some particular purposes, but which
are not, by the first needs of speech, always on our lips.

To have done with, to have come to an end of; have fin-
ished; cease to have part or interest in or connection with:
as, I have done with speculating; I have done with you for

III. *auxiliary and substitute*. 1. As an auxil-
iary, *do* is inflected, while the principal verb is
in the infinitive without *to*, and originally and
strictly the object of *do*: thus, *I do know* is I
perform an act of knowing. Compare *shall* and
will.

O blessed Bond! O happy Marriage!
Which doest the match twixt Christ and us presage!
Sylvester, tr. of Du Bartas's Weeks, l. 6.

The youth *did* ride, and soon *did* meet
John coming back amain. Cooper, John Gilpin.

Certain uses of *do* as an auxiliary, with both transitive
and intransitive verbs, may be pointed out. (a) In form-
ing interrogative and negative expressions: as, do you
want this book? I do not long for it; does he do his work
well? he does not do it as well as I expected.

You seem to marvel I do not marry all this while, con-
sidering that I am past the Meridian of my Age.
Howell, Letters, l. vi. 60.

(b) With the imperative, sometimes, to help the expres-
sion of the subject: as, do thou go (instead of go, or go
thou); do you stay here (instead of stay, or stay you here).

(c) To express emphasis: as, I do wish you had seen him;
I did see him; do be quick; do not (don't) do that. (d) Some-
times (now chiefly in poetry, where it is often used for
merely metrical reasons, but formerly often in prose)
merely as an inflection of the principal verb, with no other
effect.

A fair smooth Front, free from least Wrinkle,
Her Eyes (on me) like Stars do twinkle.

Shak., Hamlet, iii. 2.

This just reproach their virtue does excite.
Dryden.

2. *Do*, being capable of denoting any kind of
action required by the circumstances in con-
nection with which it is used, is often employed
as a substitute for the principal verb, or for the
whole clause directly dependent upon it, to
avoid repetition: as, conduct your business on
sound principles; so long as you *do*, you are safe.
In such an expression there is an ellipsis of the prin-
cipal verb or of *this, that, these things, so, &c.*: as, I in-
tend to come, but I do not you will know how to act;
so long as you *do* (so), you are safe.

The next morrow we sayd masse as we *did* the towsday
be for.

wear well.

much more common and comprehensive verb

intertwined that it is impossible to separate
them completely. All uses not obviously be-
longing to *do*² it is best to refer to *do*¹. Same

the right modern form: see *do*¹.] To suit; be

*do*⁴ (*dō*), *v.* [A mere syllable, more sonorous
than *ut*, for which it is substituted.] In *solmi-*
zation, the syllable now commonly used for the
first tone or key-note of the musical scale, and
also for the tone C (as the key-note of the typi-
cal scale of the pianoforte keyboard). About
1670 it replaced the *Arethman ut*, which is still somewhat
used in France. In the tonic sol fa system it is spelled
do, and indicated by its initial *d*; its significance is lim-
ited to the first tone of the scale, without reference to the
key-board. In teaching sight-singing by the help of sol-
mi-zation, two general methods are in use: (a) the *fixed-do*
method, in which *do* is always applied to tones bearing
the letter-name C, whether they are key notes or not; and
(b) the *movable-do* method, in which *do* is always applied
to the key-note, whatever be its letter-name. The second
method is generally regarded as the more scientific, and
is far the more practical, although the first has had the
support of many excellent musicians.

Thus they believed the incarnation, crucifixion, and resurrection of Christ to have been mere appearances or illusions. Strictly this name seems to have belonged to a single sect of the second century, but it is commonly used indifferently or collectively of the various Gnostic sects which held similar views on this point. The water-space may communicate freely with the stream or harbor, or the entrance to it may be closed by a gate or by a lock. If provided with a lock or gate, the level of the water within the dock remains at all times nearly the same, as the gate is opened only at full tide, when the level without and within is the same. If a lock is employed, vessels can pass in and out at all stages of the tide, but this does not materially affect the level of the water inside the dock. In an open dock the tide continually lowers or raises the vessel, and this interferes in some degree with the work of loading or unloading. The closed docks are free from this

inconvenience, while a greater advantage is found in the absence of currents. In a larger sense the term is also applied to a basin or inclosed water-space for the storage of floating timber or the safe-keeping of river-steamers, barges, or canal-boats laid up for the winter, and by a further extension is made to include the wharves and warehouses on or in the neighborhood of a dock. The largest closed docks are at Liverpool and London, in England. In a particular sense the term is also applied to the construction and apparatus used in repairing and building ships, as the *floating dock*, *dry-dock*, *depositing-dock*, and *sectional dock*.

The *saide* shippe, called the *Holy Crosse*, was so shaken in this voyage, and so weakened, that she was layd vp in the *docke*, and neuer made a voyage after. *Hakluyt's Voyages*, II. l. 98.

Depositing-dock, a caisson or an elevator for lifting vessels from the water and placing them upon stayings or wharves erected for the purpose. The lifting apparatus consists of a series of caissons or pontoons, placed side by side and joined at one end to another pontoon that, with a series of upright tubular structures, forms a pier and makes the back of a comb-like structure, of which the pontoons are the teeth. In the rear of the pier is a large floating pontoon, connected with it by two rows of heavy booms that, being pivoted at each end, serve as a series of parallel bars and keep the entire structure upright while afloat. To lift a vessel, a row of blocks with shores and chocks is arranged on top of all the pontoons. The air is allowed to escape, and the entire structure, except the float in the rear, sinks till the vessel can be floated over the pontoons. When the vessel is in position the water is pumped out of the pontoons, and they all rise together, lifting the vessel out of the water.—**Dry-dock**, a dock or an excavated basin adjoining navigable water, provided with a gate, and so arranged that, after the docking of a ship, the water can be exhausted from it. Such docks are long and narrow, with sloping sides formed in steps. The modern method of construction is to excavate the basin in the shore, and to drive heavy piling along the bottom and upon the sloping sides and rear end. Upon the piles are laid heavy timbers to form the floor and the steps at the sides. At the entrance are double gates opening outward, and meeting at an angle when closed, to resist the pressure of the water on the outside when the dock is empty. A recent method of closing a dry dock is by means of a float-

Dry-dock, or Graving-dock.

ing gate or caisson with flat bottom and wide stem and stern, which is floated into position across the entrance and loaded with water-ballast till it sinks, fitting tightly by a keel into a groove in the gateway. To use the dock, the gate is opened, or floated away at high water, and the ship is drawn into the dock and held afloat over a line of blocks along the center of the dock. The gate is then put in position, and sunk till the dock is closed water-tight. The water within the dock is then exhausted by steam-pumps, leaving the ship supported on the blocks, and braced on both sides by shores extending to the dock-steps. A typical dry-dock is the Brooklyn Navy-yard Dock No. 1, which is 500 feet long, 60 feet wide at the bottom, and capable of admitting a ship drawing 18 feet. Steam-pumps with a capacity of 40,000 gallons of water a minute are used to empty it.—**Floating dock**, a capacious wooden or iron structure, generally rectangular, intended to serve as a graving-dock. Sometimes floating docks are built in water-tight compartments, and can be sunk to the required

depth by the admission of water into these compartments. When the vessel is docked, the floating dock is raised by pumping, till its bottom touches the keel of the ship. Shores are then added to keep the ship in position, and the dock is raised higher. Instead of compartments, water-tight tanks are occasionally used, and the dock is raised and

lowered on the same principle. A floating dock may also be made so heavy as to sink by its own weight deep enough to receive the largest vessel, and be raised by means of empty water-tight tanks, which lift dock and ship by their buoyancy.

Graving-dock, a dry-dock; so called because used in graving or cleaning the bottom of ships. The graving docks in the navy-yards of Brooklyn, Boston, and Norfolk are important examples.—**Half-tide dock**, a basin connecting two or more docks, and communicating with the entrance basin.—**Sectional dock**, a floating dock composed of a succession of pontoons or calissons attached to a platform below the vessel. Steam-pumps are used to remove the water from the calissons, and, as they float, the vessel is raised.

(b) A register of judgments, more specifically of money judgments. Thus, a judgment for the foreclosure of a mortgage and sale of the property is not docketed in this sense; but if after sale there remains a deficiency for which a defendant is personally liable, the judgment for the deficiency is docketed against him, thus being made a lien on his real property in the county or district. 2. In a university, one who has passed all the degrees of a faculty, and is thereby empowered to teach the subjects included in the faculty; a person who has received the highest degree in a faculty: as, a doctor in divinity. The degree is also regularly conferred by certain technical schools, as those of medicine, and, under certain conditions, by colleges. An honorary degree of doctor, as of divinity or law, is often conferred by universities and colleges. The degree of doctor differs only in name from that of master. When there was but one degree in each faculty, the graduate was called a *master* in Paris, a *doctor* in Bologna. The faculty of the decretals being modeled after that of Bologna, those who took the highest degree in law were called *doctors*. This title was afterward extended to masters in theology, and finally to masters in medicine. The degrees of doctor conferred by universities, colleges, and professional schools include doctor of divinity (*L. divinitatis doctor*, abbreviated *D. D.*); or *magister theologie doctor*, abbreviated *S. T. D.*, or *doctorthologie*, abbreviated *D. T.*; doctor of medicine, abbreviated *D. M.* (*L. medicinae doctor*, abbreviated *M. He [Melbourne] said a doctrinaire was a fool, but an honest man. *Greville*, Memoirs, Sept. 25, 1834.

In our opinion, there is no more unsafe politician than a conscientiously rigid doctrinaire, nothing more sure to end in disaster than a theoretic scheme of policy that admits of no pliability for contingencies.

Lowell, Study Windows, p. 160.

2. In French hist., during the period of the Restoration (1815-30) and later, one of a class of politicians and political philosophers who desired a constitution constructed on historical principles, especially after the analogy of the British constitution. II. *a.* Characteristic of a doctrinaire or impractical theorist; merely theoretical; insisting

upon the exclusive importance of a one-sided theory.

The whole scheme [of civil-service organization] of 1870 and 1876 must be pronounced to have been a grave mistake: it is doctrinaire, academical, and quite unadapted to the practical requirements of the public offices.

See *probability*. — **Doctrine of correspondences.** See *correspondence*. — **Doctrine of cy-pres.** See *cy-pres*. — **Doctrines of definite proportions.** See *atomic theory*, under *atomic*. — **Doctrine of enumerated powers.** See *enumerated*. — **Doctrine of occasional causes.** See *occasional*. — **Monroe doctrine.** In American politics, the doctrine of the non-intervention of European powers in matters relating to the American continent. It received its name from statements contained in President Monroe's annual message to Congress in December, 1823, at the period of a suspected concert of the powers in the Holy Alliance to interfere in Spanish America in behalf of Spain. The following are the most

significant passages in the message: "We could not view an interposition for oppressing them [the Spanish-American republics] or controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition toward the United States." "The American continents should no longer be subjects for any new European colonial settlement."

The only thing which the *Monroe Doctrine* really contains is the intimation on the part of the United States of a right to resist attempts of European Powers to alter the constitutions of American communities.

G. F. Fisher, Outlines of Universal Hist., p. 602.

= *Syn.* 1. *Precept, Doctrine, Dogma, Tenet.* *Precept* is a rule of conduct, generally of some exactness, laid down by some competent or authoritative person, and to be obeyed; it differs from the others in not being especially a matter of belief. (See *principle*.) *Doctrine* is the only one of these words referring to conduct, and in that meaning it is biblical and obsolescent. In the Bible it refers equally to teaching as to the abstract truths and as to the duties of religion: "In vain they do worship me, teaching for doctrines the commandments of men" (Mat. xx, 2). As distinguished from *doctrin* and *tenet*, *doctrine* is a thing taught by an individual, a school, a sect, etc., while a *dogma* is a specific doctrine formulated as the position of some school, sect, etc., and presented for acceptance as important or essential. *Dogma* is falling into disrepute as the word for an opinion which one is expected to accept on pure authority and without investigation. *Tenet* is a belief viewed as held, a doctrinal position taken and defended. It is equally applicable to the beliefs of an individual and of a number; it has no unfavorable sense.

faces of an ordinary icosahedron. It has 12 faces, 32 vertices, 30 edges, 5 sides per face, and 5 sides per vertex. dodo (dō'dō), *n.* [*< Pg. doudo, a dodo, < doudo, doudo, a shapleton, a fool, < doudo, doido, adj., simple, foolish. According to Diez, this word, which is unknown in Spanish, came from England (?) : E. dial. (Devon) dōd, stupid, confused: see dōd. Cf. booby, a bird so named for a similar reason. The bird was also named by the Dutch (1) walghe-rogel, now walg-rogel, lit. 'nauseous bird'; (2) dōd-aers, lit. 'dead-arse,' 'propter sedam posterioris partis crassitiam' (note dated 1626), or because of some resemblance to the dabeleek or little grebe, which was also so called; also (3) dromte (> Dan. dromte = Sw. dromt); origin unknown. tus, the type of the family *Dididae* and suborder *Didi*, now usually assigned to the order *Columba*. The dodo was living in Mauritius on the discovery of that island by the Portuguese under Mascarenhas in the beginning of the sixteenth century, and it is known to have survived until July, 1681. Knowledge of the bird was for some time confined to the quaint and often questionable narratives of voyagers, certain pictures, mostly by Dutch artists, and a few fragmentary remains. In 1806 bones in abundance were found, and the osseous structure has been described in detail. The dodo was a massive, clumsy, flightless, and defenseless bird, about as large as a swan, covered with downy feathers, with a very stout hooked bill, short strong legs, short tail, and wings too small for flight; so that it soon succumbed under the new conditions which the occupation of the island introduced. Its extinction being probably due as much to the animals which man introduced as to the human invaders of the island. The solitaire (*Pezophaps solitaria*) of Rodriguez, an island of the same group, was similar to the dodo, but sufficiently distinct to be placed in a different genus. (See *solitaire*.) The neighboring island of Réunion or Bourbon also had a dodo, in all probability a third kind.

You shall receive . . . a strange fowle: which I had as the Island Mauritius called by y^e Portingalls a *De Do*: which for the rareness thereof I hope will be welcome to you.

Manuel Alham, letter written in 1693.

[This is the earliest known English mention of the bird.]

The *Dodo* comes first to a description: here add in Dryden's (Rodriguez) (and no where else, that I ever could see or hear of) is generated the *Dodo* (a Portuguese name it is, and has reference to her similitudes), a bird which for shape and rareness might be call'd a Phoenix (wer't in Arabia).

The general Teut. and Indo-European name for the dog appears in *hound*, q. v. Hence in comp. *bandog*, *bulldog*, etc.] 1. A quadruped of the genus *Canis*, *C. familiaris*. The origin of the dog is a question most difficult of solution. Some think the breed is derived from the wolf, others affirm it to be from a familiarized jackal; all agree that no trace of it is to be found in a primitive state, the whole of India and the dinags of Australia being wild descendants from domesticated ancestors. The view now generally taken by naturalists is that the dog is neither a species, in the zoological sense, nor even the descendant of any one species modified by domestication, but that the dogs of different parts of the world have a correspondingly various ancestry, from different wild species of the genus *Canis*, as wolves, foxes, and jackals. This view is supported not only by the enormous differences between dogs, but also by the readiness with which nearly all dogs cross with their wild relatives; and, accordingly, the name *Canis familiaris* is a conventional rather than a proper zoological designation of the dog as a species. No satisfactory classification of the different kinds of dogs has been arrived at, what some naturalists regard as types being regarded by others as mere mongrels. An old classification grouped dogs in three classes, the *Celeres*, *Sagaces*, and *Pugnaces*. Colonel Hamilton Smith groups the domestic dog into six sections: (1) the *wolf-dogs*, including the Siberian, Eskimo, Newfoundland, Great St. Bernard, sheep-dog, etc.; (2) *watch- and cattle-dogs*, including the German boar-hound, Danish dog, dog of

the North American Indians, etc.; (3) the *greyhounds*, as the different kinds of greyhound, Irish hound, lurcher, Egyptian street-dog, etc.; (4) the *hounds*, as the bloodhound, staghound, foxhound, harrier, beagle, pointer, setter, spaniel, springer, cocker, Blenheim dog, pointer, etc.; (5) the *ears*, including the terrier and its allies; (6) the *mastiffs*, including the different kinds of mastiff, bulldog, pug-dog, etc. All these are artificial varieties, having comparatively little stability, their distinctive characters being soon lost by reversion to a more generalized type if they are left to interbreed. This tendency to reversion requires to be constantly counteracted by "artificial selection" at the hands of breeders, in order that the several strains may be kept pure, and their peculiarities be perpetuated along the desired lines of specialization. The best-bred dogs, of whatever kind, are those furthest removed from an original or common type of structure. The differences between dogs of all kinds are vastly greater than those found among individuals of any species in a state of nature; so great that, were they not known to be artificial, the dog would represent several different genera of the family *Canidae* in ordinary zoological classification. In fact, some genera, based upon actual and constant differences in the dental formula, have been named in order to signalize certain structural modifications which are found to exist, affording an example of the evolution of generic characters as well as of specific differences. These variations extend not only to size and general configuration, character of the pelage, and other outward features, but also to positive osteological and dental peculiarities, more marked probably than those of any other domesticated animals. The corresponding physiological and psychological differences are equally decided, as witnessed in the dispositions and temperaments of dogs, their comparative docility, intelligence, etc., and consequently the uses to which they are or may be put. In the matter of size alone, for example, some toy dogs are tiny enough to stand easily on one of the fore paws of a large dog. Throughout the endless varieties, however, the influence of heredity is witnessed in the readiness with which dogs interbreed with one another, and cross with wolves, foxes, and jackals, bearing fertile progeny in all cases, and the readiness with which they revert to the wild state of their several ancestors. See the names of the several breeds. See also *Canidae* and *Canis*.

The *Dogger Series* rests upon the alum shale (Upper Lias) in Yorkshire, where *dogger* is a provincial word meaning a rounded stone, in allusion to the rounded appearance caused by atmospheric action on the large blocks into which the rock is divided by joints. The dogger is much worked for the iron ore which it contains. This name as used by Continental geologists is the equivalent of that part of the Jurassic series which corresponds to the Lower Oolite of the English geologists. It is the Brown Jura of the Germans, and is there divided into three groups distinguished by their fossil remains. The entire series consists of many alternations of clays, marls, shales, and sandstones, frequently containing iron ore, as is the case in England.

Scott.

Nothing is more commendable in a philosopher than the courage, in the face of the opposing dogmatisms of materialistic and metaphysical theories of the universe, to admit that there are some things which we do not know.

Mind, XII. 504.

2. In the Kantian philosophy, a dogmatic method in metaphysics; an uncritical faith in the presumptions of reason.

Our critique is not opposed to the dogmatical procedure of reason, as a science of pure knowledge (for this must always be dogmatical)—that is, derive its proof from sure principles, a priori; but to dogmatism only—that is, to the presumption that it is possible to make any progress with pure philosophical knowledge, consisting of concepts, and guided by principles, such as the reason has long been in the habit of employing, without first enquiring in what way, and by what right, it has become possessed of them. Dogmatism is therefore a dogmatical procedure of pure reason, without a previous criticism of its own powers.

Kant, *Critique of Pure Reason*, tr. by Max Müller.

Do we explain experience as the product of the non-Ego, we have the system which may be called Dogmatism; do we explain the whole as springing from the Ego, we have Idealism.

two known as *skilling* and *stapencus* in New York and some other States, and by other names elsewhere, were abundant in the United States during the latter part of the eighteenth and the first half of the nineteenth century. The Spanish dollar coined in Spain was rare, but the intrinsic value of the two coins was the same. By an act of January 1824,

1837, the dollar was made to consist of 412½ grains of fine, the quantity of pure silver remaining the same, 371½ grains. This dollar, being worth in market value from 100 to 104 cents, went out of circulation. An act of March 3d, 1849, directed the coining of gold dollars of 25.8 grains of fine, 23.22 being pure gold, and by act of February 12th, 1873, this was declared the unit of value of the United States. The coining of gold dollars was suspended by the act of September 26th, 1890. An act of February 28th, 1878, directed the Secretary of the Treasury to purchase silver bullion, not less than 32,000,000 nor more than 44,000,000 per month, and cause it to be coined into standard silver dollars. This was repealed by the Sherman act of July 14th, 1890, which provided for the purchase of 4,500,000 ounces of silver each month and the coining of 2,000,000 ounces a month. This act was repealed in 1893. The coins representing fractional parts of the dollar are: in silver, the half-dollar and quarter-dollar, or 50-cent and 25-cent pieces; the dime or 10-cent piece; in nickel, the half-dime or 5-cent piece (originally in silver, and inconveniently small); and in bronze, the cent (originally in copper, and much larger) and the 2-cent piece. There is also a 3-cent piece, originally coined in silver and afterward in nickel, which has been little used owing to its inconvenient smallness in both forms. By the term *dollar* in the United States notes is intended the coined dollar of the United States, a certain quantity in weight and fineness of gold or silver, authenticated as such by the stamp of the government. Sometimes abbreviated *do.*, but commonly represented by the symbol \$ (the dollar-mark) before the number. See *coinage ratio*, under *coinage*.

The Almighty *Dollar*, that great object of universal devotion throughout our land, seems to have no genuine devotees in these peculiar villages.

Irring, The Creole Village.

The Congress of 1793 fixed the monetary unit of the United States in coin, gave it the name *Dollar*, made it the unit of the money of account in their offices and courts, (and) named also its multiples and fractions.

A structure consisting of one large unhewn stone resting on two or more unhewn stones placed erect in the earth: a term also frequently used as synonymous with *cromlech*. The name is sometimes given also to structures where several blocks are raised upon pillars so as to form a sort of gallery. The most remarkable monument of this kind is probably that known as the Pierre Couverte, near Saumur, in France. It is 61 feet long, 14 feet wide,

Constantine Dolmen, Cornwall.

and about 6 feet high, and consists of four upright stones on each side, one at each end, and four on the top. The great stone of the dolmen represented in the accompanying cut is 33 feet long, 14½ feet deep, and 14½ feet across; it is calculated to weigh 750 tons, and is poised on the points of two natural rocks. It is now generally believed that dolmens were sepulchers, although afterward they may have been used as altars. They are often present within stone circles. The dolmen was probably a copy of a primitive rude dwelling, and may sometimes have been the actual structure in which the savage sheltered himself, converted afterward into his tomb. In several cases one of the stones is pierced with a hole. This is supposed to have been for the purpose of introducing food to the dead. Conclusions in regard to the original identity of various races have been based on the similarity of such structures in various parts of the world, as in Hindustan, Ceylon, Algeria, and Europe; but too much importance may be attached to this, as the inclosed dolmen is simply the structure which savages of a very low type of whatever race, would naturally erect for shelter. See *cromlech* and *menhir*.

domicile, domicil (dom'i-sil), *n.* [= D. domicilio = G. Dan. Sw. domicil, < OF. domicile, F. domicile = Pr. domicili = Sp. Pg. It. domicilio, < L. domicilium, a habitation, abode, < domus, a house (see dome), + -cilium, perhaps connected with *cella*, a cot, hut, cell, and *celare*, cover, hide: see cell, conceal.] 1. In general, a place of residence of a person or a family; in a narrower sense, the place where one lives; a place of habitual abode, in contradistinction to a place of temporary sojourn.

Let him have no culinary fire, no domicile; let him, when very hungry, go to the town for food.
Sir W. Jones, Ordinances of Menu, xli.

2. In law, the place where a person has his home, or his principal home, or where he has his family residence and personal place of business; that residence from which there is no present intention to remove, or to which there is a general intention to return. The domicile depends not on citizenship, nor on presence, but on the concurrence of two elements: 1st, residence in a place; and 2d, the intention of the person to make that place his home. Thus a man may be a citizen of one country, have his domicile in another, and temporarily reside in a third. Domicile is of three kinds: 1st, domicile of origin or nativity, depending on that of the parents at the time of birth; 2d, domicile of choice, which is voluntarily acquired by the party; and 3d, domicile by operation of law, as that of a wife arising from marriage. The term domicile is sometimes used to signify the length of residence required by the law of some countries for the purpose of establishing jurisdiction in civil actions; in Scotland, residence for at least forty days within the county constitutes a domicile as to jurisdiction. All questions relating to personal property, in matters of debt, intestacy, or testamentary disposition, are determined by the law of the place of domicile, while those relating to real property are subject to the law of the place where it is situated. The property of a foreigner domiciled in a country with which his own is at war is held to be subject to seizure as that of an alien enemy.

It would be more correct to say that that place is properly the domicile of a person in which his habitation is fixed without any present intention of removing therefrom.
Story, Conflict of Laws, III, § 43.

"Two things must concur," says the same eminent jurist (Story), "to constitute domicile—first, residence, and secondly, intention of making it the home of the party," and when once domicile is acquired it is not shaken off by occasional absences for the sake of business or of pleasure, or even by visits to a former domicile or to one's native country.

Dominical or Sunday letter, one of the seven letters A, B, C, D, E, F, G, used in the church to mark the Sundays throughout the year. The first seven days of the year being marked by the seven letters in their order, the following seven and all consecutive sets of seven days to the end of the year are similarly marked, except that in leap-years the 24th and 25th of February receive the same letter; so that on whatever day the first Sunday of the year falls, the letter which marks it will mark all the other Sundays of the year, except in leap-year, when after February 24th the dominical letter for the remainder of the year changes to the one preceding. (Many modern writers make the change of letter to occur after the end of February, the 28th taking no letter.) After twenty-eight years the same letters return in their order. The use of the dominical letter is primarily to aid in determining the date of Easter; but it may be used, by calculation, for finding the day of the week on which a given date falls in any year, past or future. To find the dominical letter of any year, let *p*, *q*, *r*, *s*, respectively, be the digits in the thousands, hundreds, tens, and units' places of the number of the year. Then, if the year is now style, find the sum $6p + 2q + 5r + 4s + 1$, and diminish it by the quotient of the year divided by 400 (neglecting the remainder). If it is old style, form the sum $5(p + 1) + q + 5r + 4s$. In either case increase the result by double the remainder after dividing the year by 4 (this remainder being taken as 4 for January and February of a leap-year). Divide the result by 7, and the remainder is the ordinal number of the dominical letter in the alphabet (the ordinal number of A being called 0).

It was established by Dominic himself also in Italy and Spain, and spread rapidly in other countries. In England its members were called Black Friars, from their black cloaks, and in France Jacobins, from the church and hospital of St. Jacques (Jacobus), in which they were first established in Paris. Their rules, based upon those of St. Augustine, enjoined poverty, chastity, fasting, and silence; but the last two may be dispensed with when they would interfere with active duties. The officers of the order are all elective. The highest, holding his place six years, is termed general; provincial and conventual priors have charge respectively of provinces and convents. The Dominicans and Franciscans, originating about the same time and long vehement rivals, were the leading orders of the Roman Church until the rise of the Jesuits in the sixteenth century. They still exist in many countries, but with reduced influence. The dress of the order is a black mantle and a white habit and scapular. An order of Dominican nuns was also founded by Dominic.

Donatist (don'a-tist), *n.* [*< LL. Donatista, Donatist, < Donatus, a man's name.*] One of an early Christian sect in Africa which originated in a dispute over the election of Cæcilian to the see of Carthage, A. D. 311, occasioned by his opposition to the extreme reverence paid to relics of martyrs and to the sufferers for the Christian faith called confessors, and the rivalry of Secundus, primate of Numidia. Secundus and the Numidian bishops declared Cæcilian's consecration invalid because conferred by Felix of Aptanga, whom they charged with being a traitor. They excommunicated Cæcilian and his party, and made one Majorinus bishop in opposition. The name Donatist came either from Donatus of Case Nigre, who headed the party of Majorinus at the Lateran Council in 313, where it was condemned, or (more probably) from Donatus "the Great," who succeeded Majorinus in 315 and under whom the schism became fixed. Repressed under Constantine, the Donatists revived under the favor of Julian the Apostate. Repressive measures, provoked by their frequent acts of fanatical violence, were resorted to from time to time. These measures, internal schisms, the conciliatory conduct of the orthodox clergy at a conference held at Carthage in 411, and the arguments of St. Augustine caused many to abandon Donatism, and the sect became insignificant, though not entirely extinct till the seventh century. The Donatist party held that it constituted the whole and only true church, and that the baptisms and ordinations of the orthodox clergy were invalid, because they were in communion with traitors. They therefore rebaptized and reordained converts from Catholicism. See *Circumcellion, Maximianist, Primitivist, Rugatist*.

Doric cyma. See *cyma*, 1.—**Doric dialect**. See II.—**Doric mode**. See *mode*.—**Doric order**, in arch., the oldest and strongest of the three Greek orders, in its external form the simplest of all, but in its most perfect examples, especially as exhibited in the monuments of the age of Pericles at Athens, combining with solidity and force the most subtle and delicate refinement of outlines and proportions that architecture has known. In a de-

based and distorted form, the Doric constituted the second order of the Romans, coming between their Tuscan and Ionic. A characteristic of the Grecian Doric column is the absence of a base; the channelings are usually 20 in number, and in section approximate to a semi-ellipse; the capital has generally no astragal, but only one or more fillets or annulets, which separate the channelings from the echinus. The profile of the capital in the best examples is a carefully studied eccentric curve, neither flat enough to be hard in effect, nor full enough to be weak. The echinus prior to the time of perfection spread out far beyond the shaft; the later Greeks made it a frustum of a cone, and the Romans cut it as an ordinary quarter-round. In good Greek examples, as a rule, no horizontal lines are found in a Doric building, floor- and cornice-lines, etc., being curved slightly upward; the profiles of the column-shafts are slightly convex, and all columns are slightly inclined toward the center of the building. All these particularities have relation to optical effects so subtle that their influence is felt rather than seen.

The first of the Roman orders is the Doric, which, like everything else in this style, takes a place about half-way between the Tuscan wooden posts and the nobly simple order of the Greeks. J. Ferguson, Hist. Arch., I. 282.

rattie = *G. schlagratte* (lit. 'sleep-rat'), a dormouse. A rodent of the family *Myoridae*. The dormouse is peculiar among rodents in having no caecum.

The general appearance is squirrel-like, hence the name *Myorid*, mice sometimes given to these animals; but the structure and general affinities are murine. Their shape is neat and graceful; they have full eyes, shapely limbs, and a long hairy tail, which in *Myorina* proper is bushy and distichous throughout, in *Muscardinus* bushy but cylindrical, in *Eliomys* tufted and flattened at the end, and in *Graphiurus* shorter and like a lead-pencil. There are about 12 species of the 4 genera named. The common dormouse is *Muscardinus arvenarius*, only about as large as the house-mouse; the fat dormouse or lemur (*Myorina glis*) and the garden-dormouse or lemur (*Eliomys nictela*) are both much larger. The dormice hibernate in a lethargic or torpid state, occasionally waking up in mild weather, and availing themselves of a stock of provisions which they have hoarded.

It is either formally settled by a written instrument, or secured by expressing the marriage contract as under the dotal rule.

The *dos* or dotal estate is something very different from our "dower." It has become the *dot* of French law, and is the favourite form of settling the property of married women all over the Continent of Europe. It is a contribution by the wife's family, or by the wife herself, intended to assist the husband in bearing the expenses of the conjugal household. Only the revenue belonged to the husband, and many minute rules . . . prevented him from spending it on objects foreign to the purpose of the settlement. The corpus or capital of the settled property was, among the Romans (as now in France), incapable of alienation, unless with the permission of a court of justice. *Moine*, *Early Hist. of Institutions*, p. 319.

2. In law, the portion which the law allows to a widow for her life out of the real property in which her deceased husband held an estate of inheritance. At common law it is one-third of such real property held by the husband at any time during the marriage as the common issue of the husband and wife might have inherited, except such property as has been conveyed with the concurrence of the wife. The wife may also bar the right of dower by accepting a jointure. By modifying statutes, in some of the United States, the dower is sometimes a share in fee, and sometimes extends only to property which the husband held at the time of his death. In England, by the Dower Act of 1833, the common law rights of the wife have been greatly modified, her dower being entirely under the control of the husband. In the earlier periods of the common law several kinds of dower were usual, as *dower ad vitam*, which was dower voluntarily devised by the husband at the porch of the church where the marriage was solemnized; and in this case the share might be less than a third, or (except for a restriction at one time imposed for the protection of the interests of feudal lords) it might be more than a third. This was, sometimes at least, done by the declaration in the marriage service "with all my lands I thee endow," or the husband might specify a particular manor or other lands. If he had no lands, or chose to mention goods only, the declaration was, as now, "with all my worldly goods I thee endow," in which case the wife, if she survived him, was entitled to a third of the personal property left by him; and if he left lands, the law, notwithstanding his omission to promise dower in them, gave her what was called *reasonable dower*, or *dower according to custom*, viz., the life estate in one third as above described, unless she had accepted a jointure or other provision in lieu of dower.

The dower of lands in English law . . . belonged to a class of institutions widely spread over western Europe,

draft¹, **draught**¹ (*dráf't*), *n.* and *a.* [This word has changed in pron. from *draught* (ME. and mod. Sc. pron. *drácht*) to *draft* (pron. *dráf*), and the fact has been recognized by the spelling *draft*, which, dating from late ME., is now the established form in the military, commercial, and many technical uses, in which the literary traditions in favor of *draught* are less felt; in other uses the spelling *draught* still prevails, though *draft* is not uncommon in many of them. There is no rational distinction between the two forms; *draft* is on all accounts preferable. (The *f* represents the changed sound of the orig. guttural; a similar change is recognized in the spelling *dwarf*.) Early mod. E. usually *draught*, rarely *draft* (dial. also *drought*, *drut*; see *drought*², *drut*), *< ME. draught*, *draucht*, *draht*, also rarely *drafte*, also, with loss of the guttural, *drarie*, a drawing, pulling, pull, stroke, etc., not found in AS. (= MD. *draht*, *dracht*, D. *draht* = Mlt. LG. *dracht*, a load, burden, = MltG. *tracht*, f. *tracht*, a load, = Icel. *dráttir*, a pulling, draft of fishes), = OSw. *dráht*, Sw. *dráht* = Dan. *dragt*, a burden, litter, draft; with formative *-f*, *< AS. dragan*, draw, drag; see *draw*. The uses of *draft* are so numerous and involved that their exhibition in linear sequence is difficult. All the senses attached to the word in either spelling with their quotations are here necessarily exhibited together under *draft*¹, *draught*¹, although, of course, most of the obsolete senses are found only in the older spelling *draught* (in its various ME. forms). Modern senses in which the spelling *draft* is still prevalent over *draft* are indicated. In cases not so indicated, *draft* is the prevalent spelling. The compounds in which *draught* is the only recorded spelling are given under that spelling.] I. *n.* 1. The act of drawing or dragging (in any sense); a drawing; a draw; a haul; a pull. 15. The drawing or moving of air; the air so drawn or moved; a confined current of air, as in a room or in the flue of a chimney. The *draft* of a chimney depends, apart from the mode of construction, on the difference of the density of the rarefied column inside the chimney, as compared with an equal column of the external atmosphere, or on the difference in height of the two columns of elastic fluid, supposing them reduced to the same standard of density. The velocity of the current is the same as that of a heavy body let fall from a height equal to the difference in height of two such aerial columns. *Drafts* may be produced or increased (a) by a blast which rarefies the air above the fire (a *blast-draft*), or (b) by blowers which compress the air beneath the fire (a *forced draft*). When a forced *draft* is used on a vessel, air is forced into the fire-room, which is closed in such a way that the air can find egress only through the furnaces and funnels. In some recent vessels increased *draft* has been secured by the partial exhaustion of the air in the uptakes and lower parts of the funnels, which causes an increased flow of air from the fire-room through the furnaces. This is called an *induced draft*.

A fabulous animal common to the conceptions of many primitive races and times, or, as in the Bible, an indefinite creature of great size or fierceness. When described or depicted, it is represented as either a monstrous serpent or a lizard (like an exaggerated crocodile), or a compound of both, or (as in heraldry) as a combination of mammalian and reptilian characters; but always as winged, with fiery eyes, crested head, and terrible claws. It is often represented as blood-red and spouting fire, and sometimes with several heads, like the Hydra; and in the myths of the Scandinavians and other races, dragons are often the guardians of treasures, etc. The killing of a dragon was reckoned among the greatest feats of heroes in both ancient and medieval times; thus, the legend of St. George and the dragon is one of the most celebrated in Christian literature. The dragon is the imperial emblem of China, and is regarded by the Chinese as a sort of divinity, but by other peoples generally as the type and embodiment of fierceness and cruelty or watchful malice. In the Apocalypse "the dragon, that old serpent" is a synonym of Satan (Rev. xx, 2). In the Old Testament it is either a large land-animal or a great marine fish (Isa. xlv, 13—revised version, jackal; Ps. lxxiv, 13—revised version, dragon), a venomous land-serpent (Ps. xci, 13—revised version, serpent), or the crocodile (Ezek. xxx, 8—revised version, dragon). The same Hebrew word, *thannin*, is also sometimes translated *whale* (Gen. i, 21—revised version, sea monster; Job vii, 12—revised version, sea monster). The extinct pterodactyl comes nearest of all known creatures to the most prevalent conception of a dragon.

Sp. Berkien, Arts and Learning in America.

A drama is the imitation (in a particular way) of an action regarded as one, and treated as complete. In the observation of the process of a complete action, and in the attempt to imitate it in accordance with such observation, must therefore be sought the beginnings of the drama.

A. W. Ward, Eng. Dram. Lit., Int., p. xvii.

2. A composition in verse or prose, or in both, presenting in dialogue a course of human action, designed, or seemingly designed, to be spoken in character and represented on the stage; a form of imitated and represented action regulated by literary canons; the description of a story converted into the action of a play, and thereby constituting a department of literary art: as, the classic drama; the Hindu drama; the Elizabethan drama. The construction of such a composition is, as a general rule, marked by three stages: first, the opening of the movement; second, the growth or development of the action; third, the close or catastrophe, which must in all cases be the consequence of the action itself, as unfolded in acts, scenes, and situations. The drama, whether in actual life or mimic representation, assumes two principal forms, namely, tragedy and comedy; and from modifications or combinations of these result the mixed or minor forms, known as tragic-comedy, melodrama, lyric drama or grand opera, opera bouffe, farce, and burlesque. Other forms, suggested by the subject and the manner of presenting it, are the nautical drama, the pastoral drama, the society drama, etc. Both tragedy and comedy attained a high degree of development in the ancient Greek drama, which originated in the worship of Bacchus.

Sophocles made the Greek drama as dramatic as was consistent with its original form.

Macaulay, Milton.

It is sometimes supposed that the drama consists of incident. It consists, of passion, which gives the actor his opportunity; and that passion must progressively increase, or the actor, as the piece proceeded, would be unable to carry the audience from a lower to a higher pitch of interest and emotion.

R. L. Stevenson, A Humble Remonstrance.

In the epic poem there is only one speaker—the poet himself. The action is bygone. The scene is described. The persons are spoken of as third persons. There are only two concerned in it, the poet and the reader. In the drama the action is present, the scene is visible, the persons are speakers, the sentiments and passions are theirs.

Dion Buicard, in New York Herald, July 6, 1888.

Formerly also called *draught-bridge* and *draught*. See *draught*. Drawbridges, as applied to fortifications, date only from the beginning of the fourteenth century. At first they spanned the fosse, joining the gate of the fort or of the advanced work with its outer bank. Later, drawbridges formed only the inner portion of the platform of the bridge, the outer portion being stationary. The draw-bridge was usually raised by chains attached to levers projecting from the wall at a proper distance above it, which levers were elevated by heavy weights attached to their inner extremities, the wall forming the fulcrum. When raised, the drawbridge formed a barricade before the gate, thus providing a twofold obstacle to the assailant—a chasm and a strengthened barrier.

dredging-machine (drej'ing-ma-shén'), *n.* An apparatus for lifting mud and silt from the bottoms of rivers, harbors, canals, etc. Some dredging machines employ a single bivalve or clam-shell scoop; others a series of scoops on an endless chain; others some form of suction apparatus. The earliest form appears to have been a single box-like shovel or spoon, suspended from a crane rigged up on a large flat-boat. It was lowered into the mud, dragged along by means of ropes till filled, and then raised and emptied into the boat. Another early form is the chaplet or chain-jump, which, by means of an endless chain carrying buckets travelling in a trough, lifts mud and water, discharging them at the top into a flat alongside the machine. On this plan are now built some of the largest and most powerful dredging-machines in use. They consist of large, flat-bottomed

boats, usually of iron, with a bucket-chain carrying nearly 40 buckets, each with a capacity of about 13 cubic feet. In excavating the Suez canal, the lifting buckets of some of the larger machines had a capacity of 5 cubic feet each, and the delivery was 20 buckets a minute. For the delivery of the sand or spoil both chutes and traveling buckets were used, the spoil being, in some instances, delivered 220 feet from the dredger. The clam-shell dredger is largely used in the United States, and has the merit of ease of management, the scoop operating in a half-circle about the boat, so that a wide channel can be excavated without moving the boat. The scoop is suspended from a crane at the bow of the boat, and is operated by means of chains controlled by steam-power, two long flexible pipes serving as guides for the clam-shell. In the machines employing a suction or exhaust, a tube is lowered into the mud, and the mud and water are raised by means of a revolving disk in the tube, or by the aid of a vacuum or an ejector. A large vessel on the boat, being exhausted of air, is connected with the submerged pipe, when the mud and water readily rise into the receiver. In another form of pneumatic dredger a pipe is lowered into the silt and closed air-tight, and steam is then turned into the upper part of the pipe, driving out the air. Many other forms are used.

5. In *geol.*, loose detrital material, fragments of rock, boulders, sand, gravel, or clay, or a

mixture of two or more of these deposits, resting on the surface of the bed-rock. The term *drift* was introduced by Lyell in 1840, to take the place of *diluvium*, with which latter word the idea of a universal deluge, and especially the Noachian deluge, had been generally associated. (See *diluvium*.) The word *drift* is now usually applied to detrital deposits when it is intended to include at the same time the transportation from a distance. Almost all detrital material has, however, been formed with more or less help from running water, and therefore must in that process have been moved to a greater or less distance from the place of its origin. It is especially with reference to material lying on the surface in northern Europe and northeastern North America that the term *drift* is used at present by geologists, and it is frequently called *northern drift*, since much of it has been moved in a southerly direction. And since it is believed by most geologists to have been the principal agent by which this drift was moved, it is also denominated *glacial drift*, while the detrital material transported by the agency of ice at the present time is not so called. See *glacier* and *maritime*.

6. In *mining*, a nearly horizontal excavation made in opening or working a mine: nearly the synonym of *level*. The levels or drifts are the nearly horizontal openings in a mine; the shafts are the nearly vertical openings by which the levels are connected and made accessible. (See *tunnel* and *adit*.) A drift is wholly within the soil or rock; an open cut is open to the sky. Also *driftway*.

7. *Naut.*, the leeway which a vessel makes when lying to or hove to during a gale. Also *driftway*.

8. In *ship-building*, the difference between the size of a bolt and the hole into which it is to be driven, or between the circumference of a hoop and the circumference of the mast on which it is to be driven.—9. The horizontal oversetting force or pressure outward exerted by an arch on the piers on which it rests.—10. Slow movement of a galvanometer-needle, generally due to changes in the torsional elasticity of the suspending fiber.—11. In *mech.*, a longish round and slightly tapering piece of steel used for enlarging a hole in a metallic plate; a *drift-bolt*; a *punch*. It sometimes has grooves cut in spirals on the sides, to give it cutting edges. Also called *drifter*.—12. *Milit.*: (a) A tool used in running down the composition contained in a rocket or similar firework. (b) A priming-iron to clean the vent of a piece of ordnance from burning particles after each discharge. [Eng.] (c) In *gunn.*, same as *derivation*. 6.—13. A green lane. *N. and Q.*, 7th ser., V. 302. [Prov. Eng.]—14. Delay; procrastination. [Scotch.]

See above, 5, and *glacial*.—**Northern drift**, in *geol.*, a name given to boulder-clay of the Pleistocene period, when its materials were supposed to have been brought by polar currents from the north. 2. In *mining*, a borer: the more common term in the United States.—3. In *agri.*, a machine for planting seeds, as of grasses, wheat, oats, corn, etc., by dropping them in rows and covering them with earth. Such machines vary in form and size from a small hand-implement sowing one row to the gang-drill drawn by one or two horses, and heavy steam-power machines drawn by a rope from a traction engine, as in steam-plowing. Horse-power drills are sometimes fitted with self-feeding devices for regulating the speed and the amount of feed from the hopper to the tubes that convey the seed to the ground. They all have some form of share or tool for opening or preparing the ground for the seed, immediately in front of the tube that distributes the seed. Nearly all forms have also an attachment for covering the seed after it has been dropped. Some of the larger machines, particularly for steam-power, are combined harrows and drills. Grain-or-seed-drilling machines are sometimes called *seeders* or *sowing-machines*.

It lays its eggs in capsules containing about a dozen eggs. It ranges along the Atlantic coast from Canada to Florida, but is rare north of Massachusetts. Also called *borer* and *snail-borer*.

(a) A drill or borer which cuts by means of diamonds set like teeth in an annular bit or boring-head. The boring-head, which is a hollow cylinder, is made to revolve with rapidity by suitable machinery, so that a large hole can be made by cutting out only a small quantity of rock, a solid core of which fills the hollow of the cylinder and is broken off and removed from time to time. Knight*.—**Expanding drill**, a drill with a pair of adjustable bits which can be spread apart at any given depth, to increase the width of the hole at that point.—**Finishing-drill**, any form of drill making a smooth cut, used to follow a drill doing rapid but rough work.—**Fluted drill**, a drill upon which are formed, on opposite sides, two longitudinal grooves or flutes. The cutting-edges at the point are formed by the edges of these flutes, which are cut away in conical form.—**Forked drill**, a slotting-tool with a forked point, used in a slot-drilling machine. It is either forged and ground from solid steel or formed by fixing two movable cutters in a stock. Its action is rapid, but it leaves a rough surface, and must be followed by a finishing-tool.—**Lip drill**, any flat drill upon the cutting edge of which a lip is formed, either by grinding or during the process of forging. The lip adds to the speed and cleanliness of working.—**Persian drill. (a) A hand drill operated by a nut moved backward and forward over a quick screw on the stock of the drill. Also called *Archimedes drill*, *serp-stock drill*.—**Piercing drill**, a drill for making a hole, as distinguished from a finishing-drill or a slotting-drill.—**Pin drill**, a drill having a cylindrical pin projecting from the center of its cutting face. It is used to enlarge a hole previously made, or to face off the surface around such a hole, the pin being inserted into the hole and holding the tool true.—**Plain drill**, a drill of which the angular cutting end is formed on a shank flattened on opposite sides toward the point. Such drills do fair work for small holes, but should be made with the narrow sides parallel for a short distance from the point, to afford guidance to the tool in the hole, as well as for the needs of sharpening.—**Pneumatic drill, a drill actuated by mechanism for which compressed air supplies the power; an air-drill.—**Rose drill**, a drill with a cylindrical cutting face, cut on the edge in a series of teeth: used for finishing, especially in slot-drilling.—**Roughing-drill**, any form of drill adapted for speedy working, but producing a rough cut, such as the forked drill.—**Screw-stock drill**. It is a form of single-acting metal-drill.—**Teat drill**, a square-faced cylindrical drill with a sharp, pyramidal projection or teat issuing from the center of the cutting face. It is used to flatten or finish the bottoms of holes.—**Twist drill**, a cylindrical drill around the body of which is carried a deep spiral groove, so that the tool appears as if twisted from a flat bar. The point is sharpened to an obtuse angle. Such drills are used in all sizes, from a diameter of three inches down.—**Vertical drill**, a drill with vertical spindle. *E. H. Knight*.—**Wall-drill**, a drilling-machine set up against a wall, and not fitted with a table to receive the work. The drilling-tool is often carried on a radial arm for facility in adjusting it to the work. It is used for large work, not adapted to be placed on a table.—**Watchmakers' drill**, a small drill with a spear-shaped head having an obtuse or but slightly acute point, the edge of which is usually sharpened evenly on both sides. In use it is generally driven alternately backward and forward.********
